(a) The two ways to have a high maximum
level u
no reset: ends near the peak
reset after the peak: ends low
position
time t
(b) Endpoint law at u = 3: theory and exact simulation
reset profile K/D
no-reset profile q(y-u)/D
leading conditional density
exact Monte Carlo, 999,599 paths with H > 3
conditional density given H_T > u
endpoint Y_T
